When performing data modeling in preparation for designing a database, knowing that two entities are related to each other is not sufficient. In addition to knowing that they are related, the cardinality of the relationship must also be documented. Cardinality is the numerical mapping between entities.

You can eliminate or reduce these anomalies by separating the data into different tables. This puts the data into tables serving a single purpose. The process to redesign the table is database normalization. Definition of Database Normalization. There are three common forms of database normalization: 1st, 2nd, and 3rd normal form. They are also abbreviated as 1NF, 2NF, and 3NF respectively.
