Genetics of the fowl. Summary. Partial suppression of the frizzled plumage of heterozygous Frizzles is induced by a recessive autosomal gene, mf, which is independent of the gene for frizzling. This modifying gene is manifested when homozygous in all birds heterozygous for frizzling and in about 40 per cent. of

Description : In this introduction to the genetics of form and feathering of the domestic fowl you will find a straightforward method that allows anyone, beginner or advanced hobbyist, to understand how the major genes of form and feathering come together to create the silhouette that is the hallmark of each breed. Beginning with a discussion of the skeleton genes, then moving to muscling genes, feathering genes and finally to comb genes, an understanding of the layers that make the ...

The fully-pearled gene is the dominant one, just like in the pearl grey. So a bird with two pearled genes (SS) will look fully-pearled. The semi-pearled gene (ss) is the recessive version here, and so you will need two of them for them to show up. A Royal Purple guinea has a grey background colour, and is semi-pearled.

Re: Elementary Genetics. Some random thoughts to share: roosters already moving like stiff soldiers can benefit from a little pepper. Capsaicin helps the movement of the gamefowl. A few drops of Chili sauce in the feed everyday will help greatly. A little oregano will ease breathing of fowl with stuffed nostrils.
